

# The Data Wrangle and Analysis Project

By Youssef Senousy

The main goal of this project is to make a good wrangle and analysis of the Twitter account @WeRateDogs from different data resources and obtain at least 8 quality issues and at least 2 tidiness issues and fix them to produce effective analysis.

We have three types of datasets:

1. Enhanced Twitter Archive Dataset
2. Predicted Images Dataset
3. Retrieved Data from Twitter API.

## Project Steps:

a) Data wrangling which consists of three main steps:

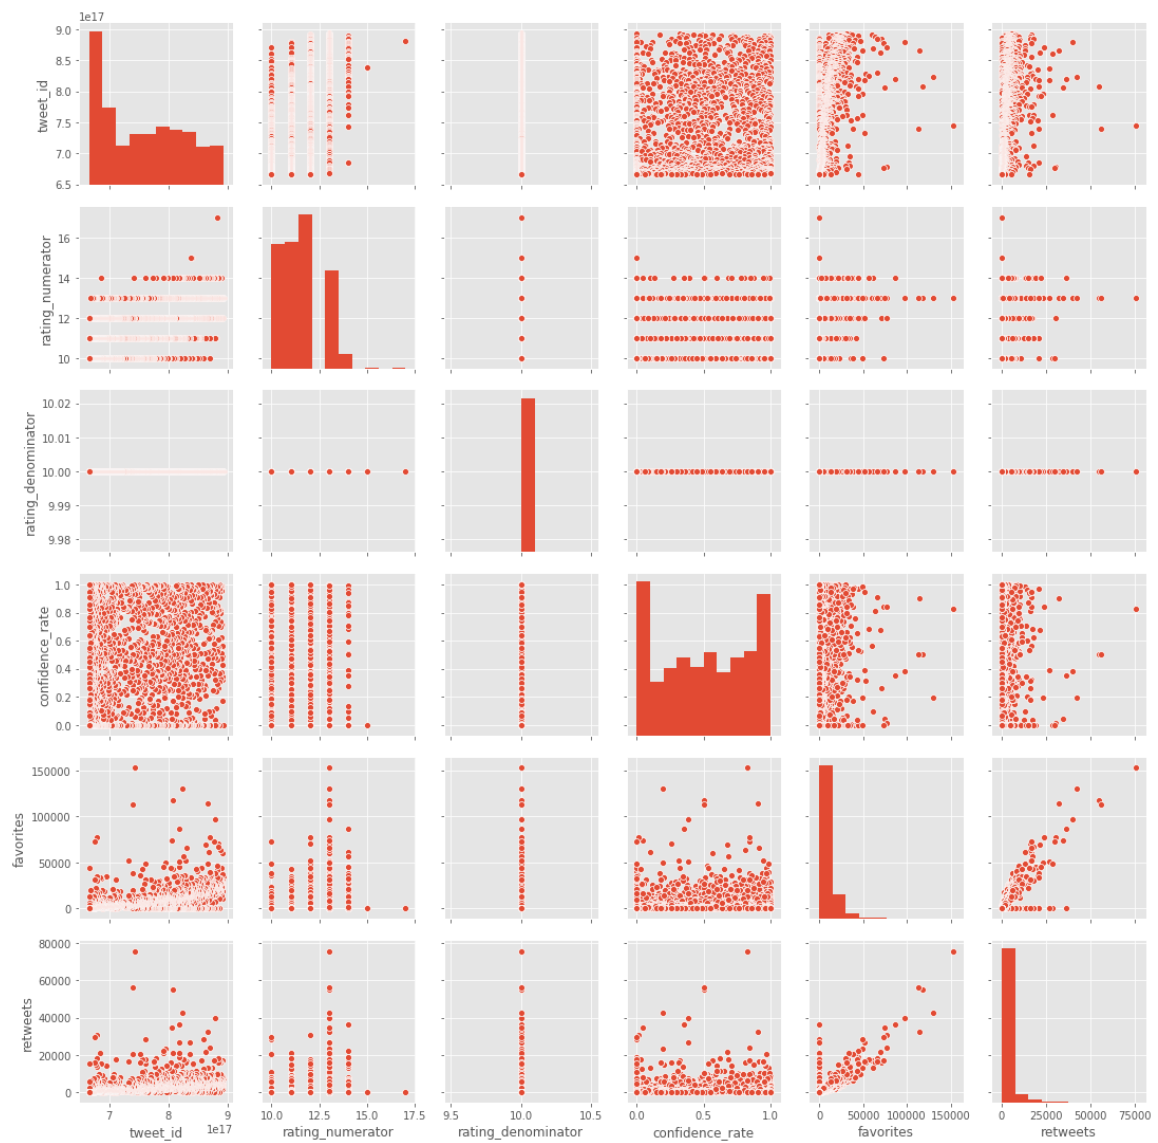

1. Gathering Datasets
2. Assessing Datasets
3. Cleaning Datasets

b) Storing the datasets after the steps mentioned above to obtain report and visualization of data.

After finishing the steps mentioned above, we found some insights from the final dataset by using some visualizations.

### A) Histograms:

## B) Correlation Heat map

## Features Analysis

Distribution of Ratings with Number of Tweets

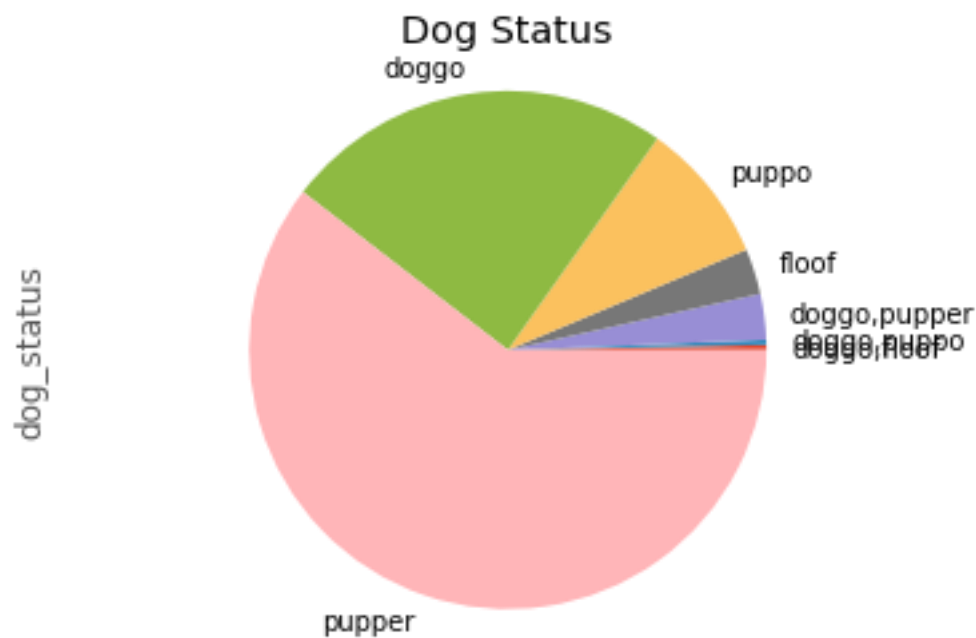

From correlation heat map we can see the strong correlation between favorite\_count and retweet\_count

The most common breed types from the dataset

The Pie Chart of the dog status

The average source of the tweets distributions

The relation between ratings and its sources.

The tweets of users distributed by time
